show wherein the user data from the selected first base station is demodulated by combining the downlink signal of the selected first base station and the downlink signals from said other base stations not selected by said mobile terminal such that the downlink signals from the other base stations are individually weighted based on the estimated uplink reception quality. Claim 1, including all the claims that depend directly and indirectly from Claim 1, Claim 6, including all the claims that depend directly and indirectly from Claim 6, Claim 18, including all the claims that depend directly and indirectly from Claim 18, and Claim 19, including all the claims that depend directly and indirectly from Claim 19, are therefore allowable.
